

Prasus Thapa

Java & Python Developer

Pokhara, Nepal | +977 9703519907 | prasusthapa@gmail.com | github.com/Prasus-Thapa | prasusthapa.vercel.app

PROFESSIONAL SUMMARY

BIT student with hands-on experience building full-stack Java applications (Servlets, JSP, JDBC, MySQL) and embedded IoT systems using Arduino. Built a role-based vehicle rental platform with complete booking workflows and a biometric attendance system integrating fingerprint, RTC, and access control hardware. Seeking a Software Engineering Internship to apply backend and systems-level thinking to production environments.

EDUCATION

Bachelor of Information Technology (BIT)

Informatics College Pokhara (Pokhara University) | Expected Graduation: 2027

Senior Secondary Education (CBSE — Class XII)

Girideepam Bethany High School, India | Graduated 2023 | Score: 93%

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, SQL, HTML5, CSS3

Backend & Database: Servlets, JSP, JDBC, MVC, MySQL

Tools: Git, GitHub, Maven, Apache Tomcat, IntelliJ IDEA, VS Code, XAMPP, Arduino IDE

CERTIFICATIONS

- Java Object-Oriented Programming — LinkedIn Learning (2025)

KEY PROJECTS

Urban Drive Solutions – Vehicle Rental Management System

Java MVC | Servlets | JSP | JDBC | MySQL

- Developed a Java MVC vehicle rental platform (Servlets, JSP, JDBC, MySQL) as part of a team, with a 4-table normalized relational database using DAO architecture.
- Designed the database schema and implemented core backend logic, including booking conflict prevention (blocking double-booking on overlapping dates) and cancellation policy handling.
- Built role-based access for admin and customer users, plus rental history tracking and vehicle search/filtering.

IoT-Based Gym Attendance & Smart Access System

Arduino | Sensors | Embedded Systems

- Contributed to a team-built biometric access and attendance system using Arduino, fingerprint sensor, RTC, EEPROM, servo motor, PIR sensor, buzzer, and LCD — tested with real students.
- Implemented attendance logging and membership validation logic, using EEPROM for persistent storage across power cycles.
- Resolved false rejection issues by adding LCD-based user feedback (e.g., "Wrong fingerprint, please try again") to guide re-scans caused by sensor placement or finger condition.

WeCare Product Management System

Python | CLI

- Built a solo Python CLI application for inventory management with 5 core features: full CRUD operations (create, read, update, delete) and invoice generation.
- Used CSV files for data persistence, with modular object-oriented design separating inventory logic, data storage, and invoice output.
